

AEGIS Web Continuation

Visual setup and mobile continuation guide

AEGIS Web Continuation - System Overview

Workflow guidance stays separate from repository execution.

IMPORTANT BOUNDARY

No new GitHub, shell, credential, merge, deploy, or usage quota permission.

This visual companion uses English labels for maximum PDF compatibility. The complete Thai instructions are in docs/USER_GUIDE_TH.md inside the same package.

1. Install on Windows

Windows Installation Flow

Preview first. Apply only after paths and conflicts are reviewed.

Preview: `powershell -ExecutionPolicy Bypass -File .\Install-AEGISWebContinuation.ps1`

Apply: `powershell -ExecutionPolicy Bypass -File .\Install-AEGISWebContinuation.ps1 -Apply`

Run the preview first and confirm `PREVIEW_ONLY` before applying changes.

```
powershell -ExecutionPolicy Bypass -File .\Install-AEGISWebContinuation.ps1
```

```
powershell -ExecutionPolicy Bypass -File .\Install-AEGISWebContinuation.ps1 -Apply
```

Restart ChatGPT desktop, open Plugins, choose Personal, install AEGIS Web Continuation, and start a new chat.

2. Connect repository execution

1. Open Codex cloud and sign in with the intended ChatGPT account.
2. Connect GitHub and select only the repository you authorize.
3. Create an environment for that repository.
4. Configure only real dependencies, variables, and secrets required by the project.
5. Start with a read-only identity check for repository, branch, and HEAD commit.

```
Inspect repository, branch, and HEAD commit only.  
Do not edit, create files, push, or open a PR.  
Report the repository capabilities available in this session.
```

The Skill is workflow guidance. Codex cloud supplies repository tools only after the repository and environment are authorized.

3. Hand off work before leaving the PC

Safe Handoff from PC to Phone

Push a verifiable checkpoint before leaving the local machine.

```
git status --short
git branch --show-current
git rev-parse HEAD
```

Commit and push only reviewed files to the exact branch. Uncommitted local files are not visible from the phone while the PC is offline.

4. Continue from phone or web

@AEGIS Web Continuation

Continue repository <owner/repo> on branch <exact-branch>.

Use commit <exact-sha> and Issue/PR <URL-or-number>.

Validate repository identity and checkpoint before mutation.

Propose a Mutation Plan, run targeted checks, and return diff plus verification.

Do not merge, push, deploy, or access credentials without explicit approval.

Expected statuses

Status	Meaning
READY_TO_CONTINUE	Identity, scope, and evidence are sufficient.
BLOCKED_REPO_ACCESS	The current session cannot access the repository.
BLOCKED_STALE_STATE	Commit, evidence, or checkpoint is out of date.
BLOCKED_SECURITY_CONFLICT	The requested task conflicts with a security rule.
NEEDS_APPROVAL	A protected operation requires explicit user approval.
READY_REVIEW	Diff and verification evidence are ready for review.

5. CLI usage-limit fallback

When Codex CLI Cannot Continue

The Skill preserves workflow state; it does not bypass usage limits.

Never claim execution without diff and test evidence.

If the latest checkpoint is on GitHub and Codex cloud tools are available, validate identity and continue.

If the latest work exists only on an offline PC, stop with BLOCKED_STALE_STATE.

If the web session is read-only, produce analysis or a handoff; do not claim repository mutation.

The Skill cannot bypass or replenish ChatGPT/Codex usage limits.

6. Go-live checklist

- ☐ Installer preview shows no conflict.
- ☐ Plugin appears in the desktop Plugins Directory.
- ☐ A new chat can invoke the Skill with @.
- ☐ The target web/mobile account can see the Skill.
- ☐ GitHub is connected only to the intended repository.
- ☐ Codex cloud environment opens the correct repository.
- ☐ Read-only identity test reports the correct branch and commit.
- ☐ A small executor-mode task produces a reviewable diff and test evidence.
- ☐ Merge, push, deploy, credentials, and network remain approval-gated.
